DEPOSITS SAVE AND DELIVERY

# The Smart Solution

- Trading has been one of the most complicated problems for a long time of human age, and we were excited to challenge ourselves to solve problems in this field. As humans, we are always looking for many solutions in different ways to each tiny problem. And because of that, we are here to do our senior project to introduce something new to the table. Also, to prove our success, we decided to address an issue that is present in our day and age.

# The Shipping Mediums

- Shipping mediums have played a very important role in global trade, and because their role contributes to the overall success of the shipping experience, we wanted to create an app that makes life easier in the world of carriers.
- We introduce to you the ForYou app.

- The ForYou app aims to simplify shipping services for different groups such as people, businesses, and shipping companies.
- For service providers, the app provides tools to manage their delivery systems effectively.
- At the same time, customers can effortlessly discover the best shipping choices for their needs.

# Looking for the best

As technology progresses quickly, there are now more choices for development. Getting excellent results, which were previously unimaginable, is achievable. But having many options makes decision-making harder. In today's competitive environment, what often sets projects apart is how fast they're finished and how users feel when they first use the app.

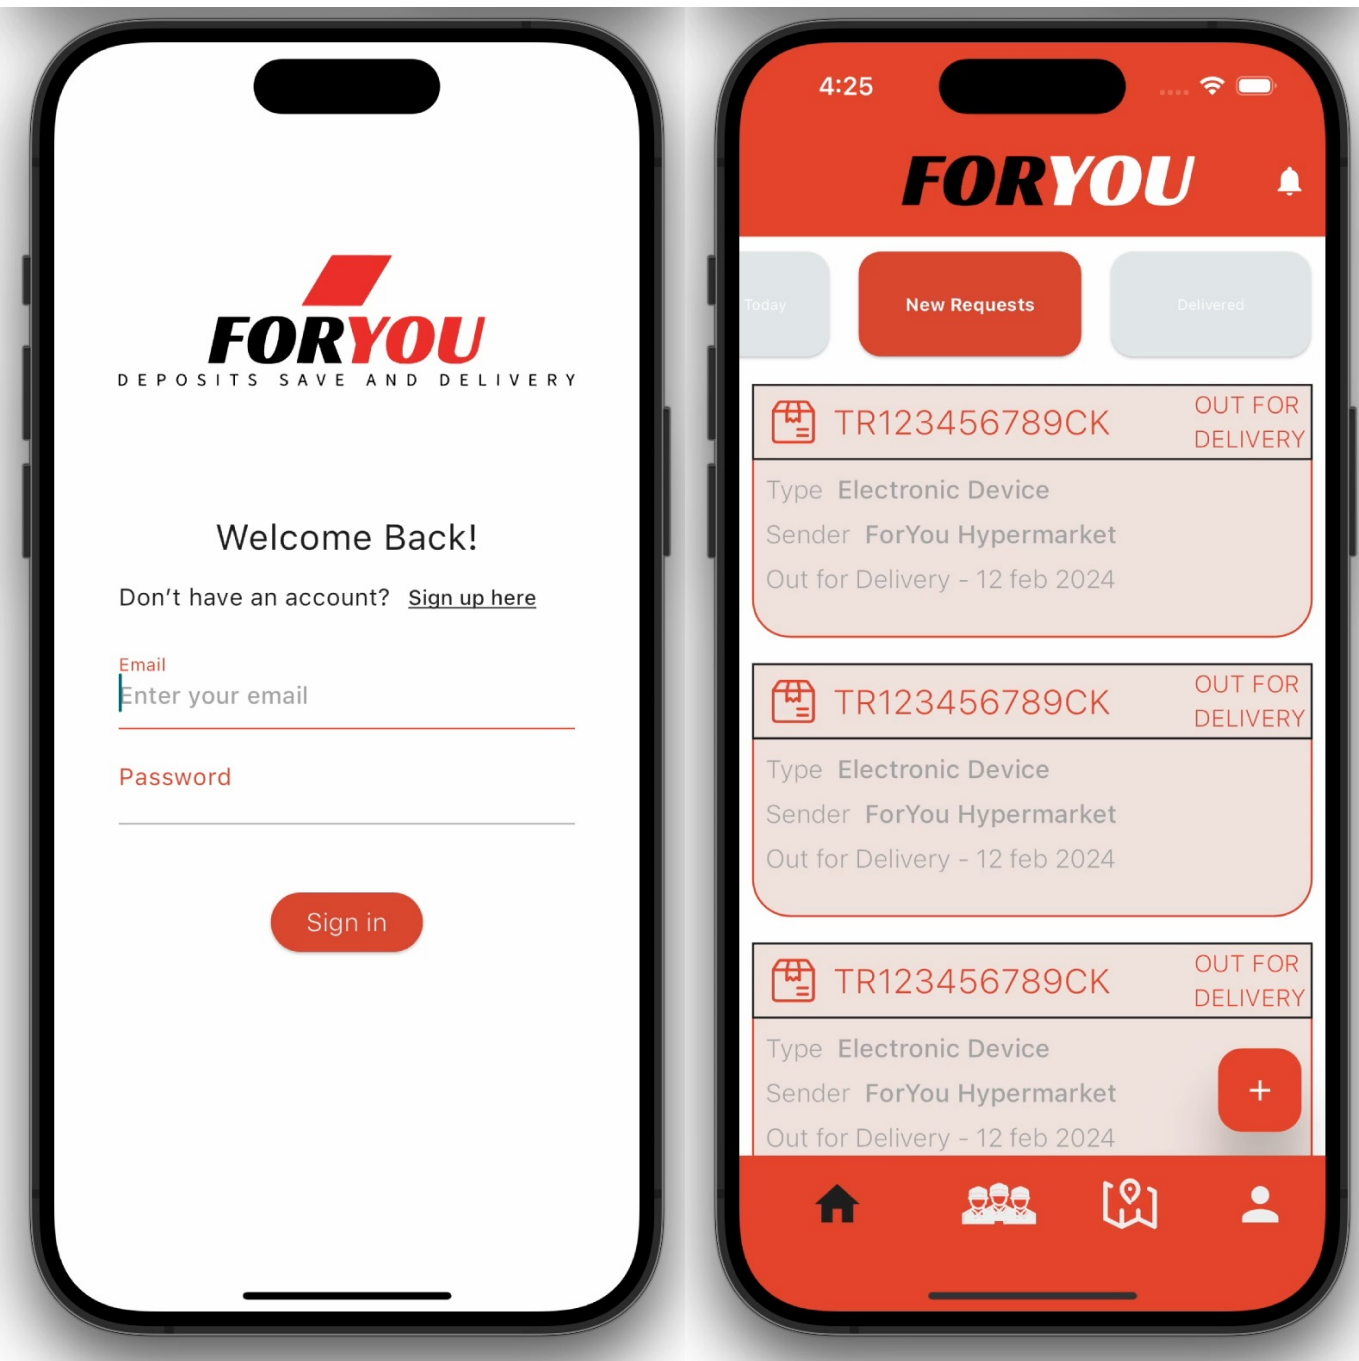

# Let's get it done

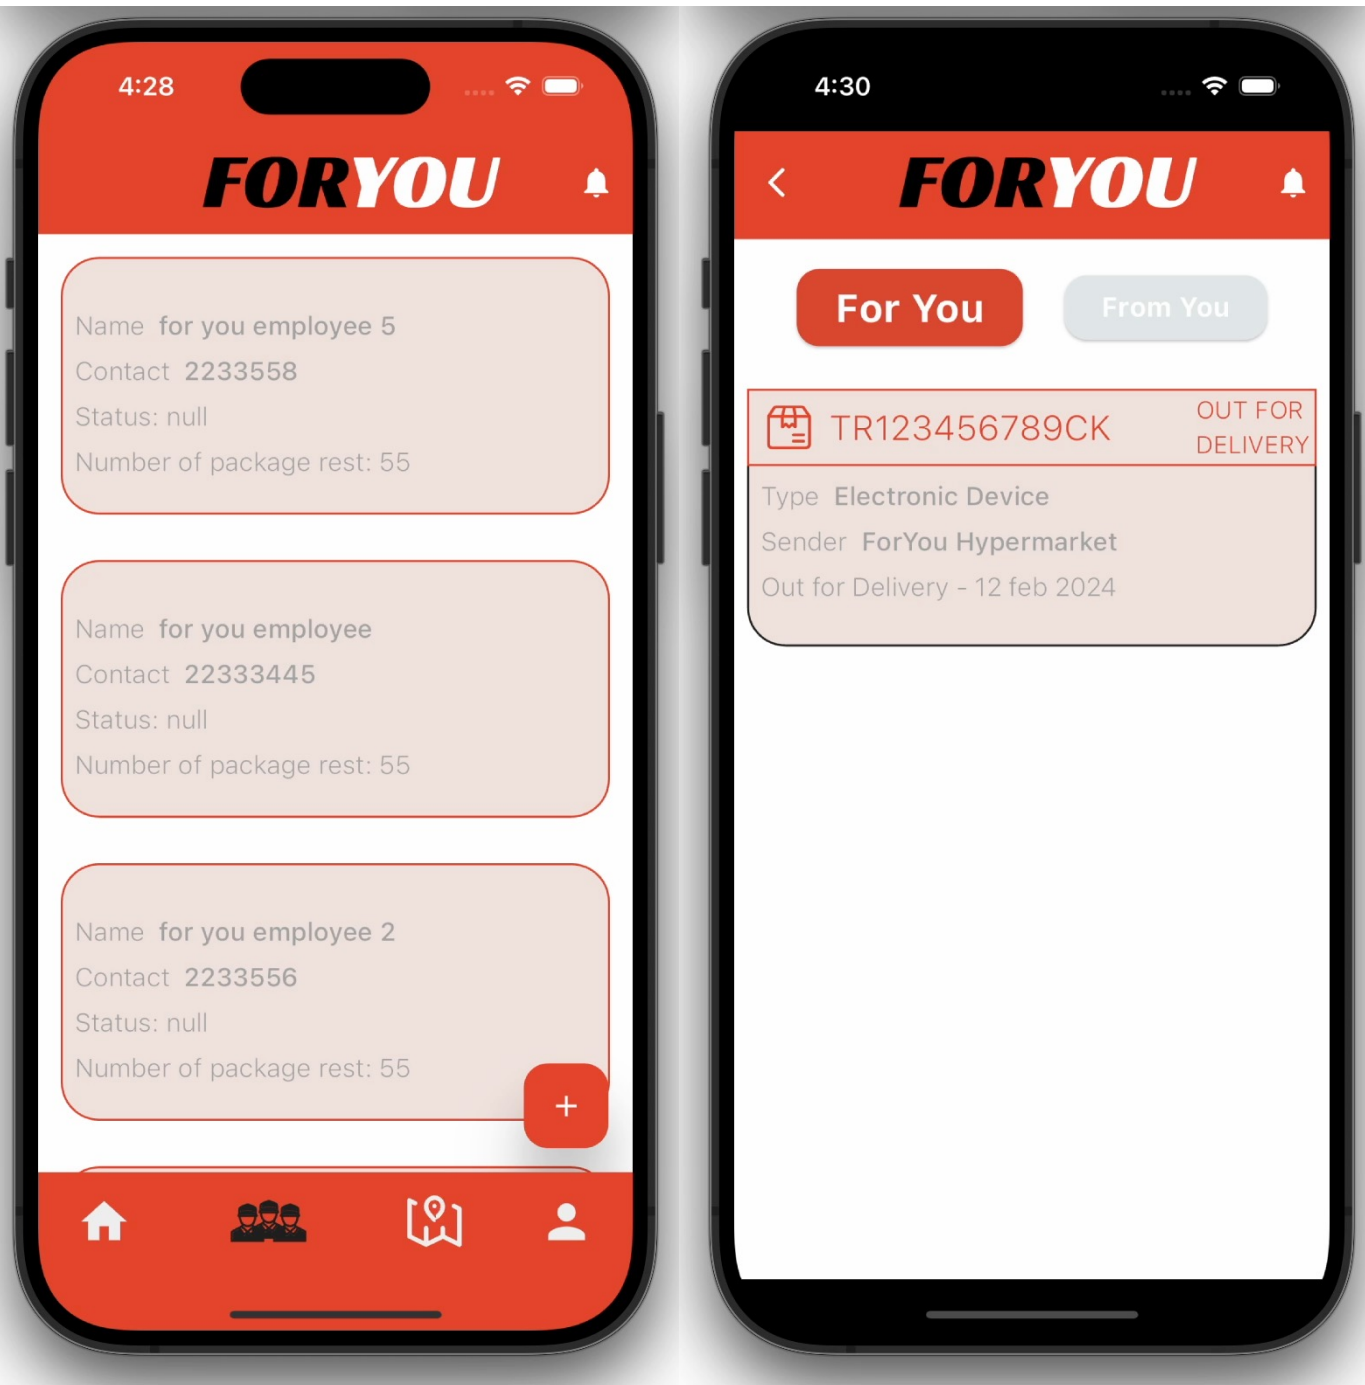

- We chose to create our app with Flutter, a fast-growing language for making mobile apps. We picked Flutter because it can work on different devices with just one set of code, and it has lots of tools available. We believe this decision will make our app last a long time without needing many development environment changes in the future.
- For designing, we used Figma because it's easy to reach our designs from any place and share them with our team for their thoughts. And to add small but effective animations that improve how users interact with our app, we used Rive.

# How it works

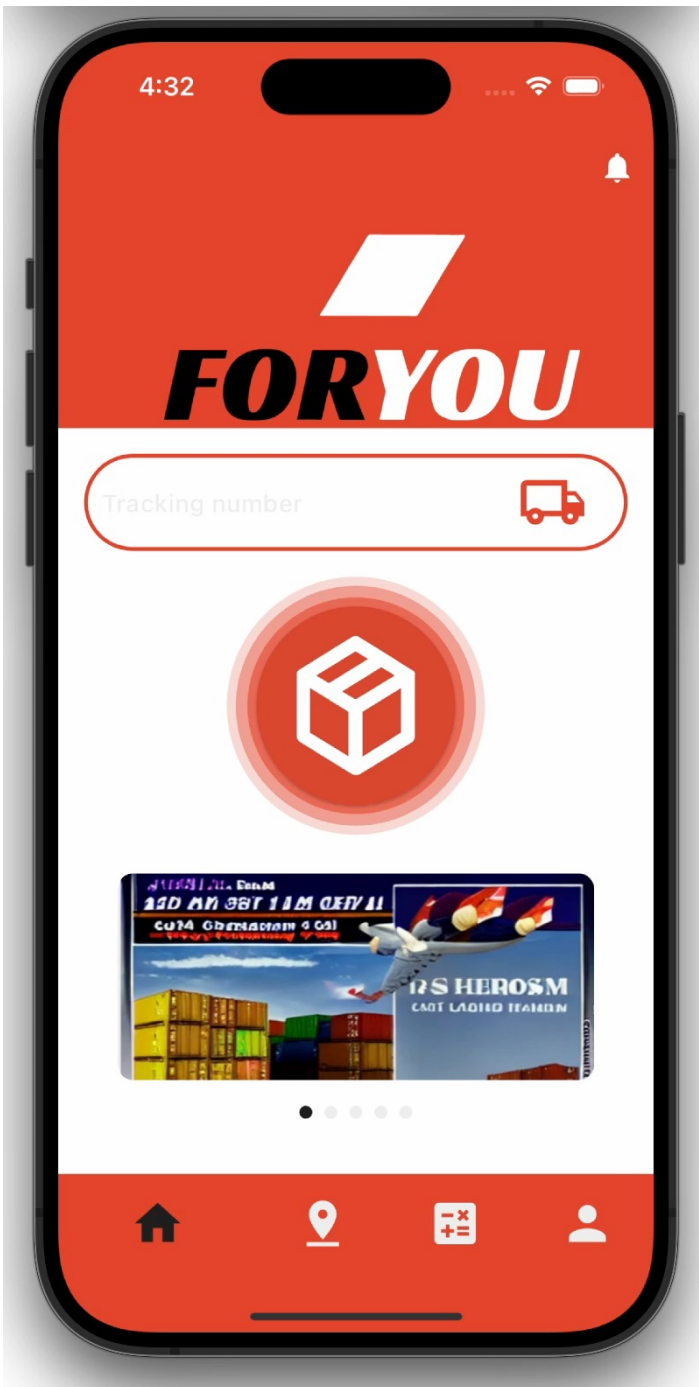

- The service providers can register, and create all settings, their addresses, rate of shipping, and add the employees.
- The Employees can log in when the Manager registers them

# How it works

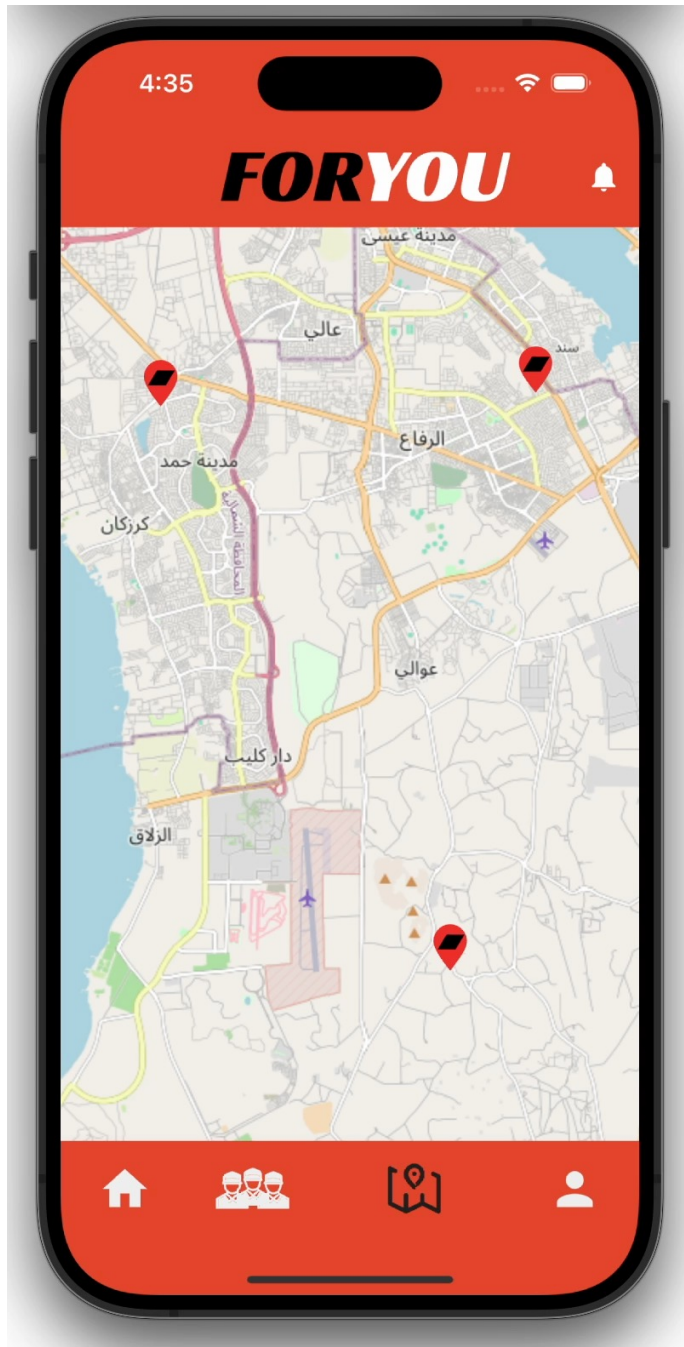

- The customer can register as a User, whichever, person or company, company with a small business or big companies like hypermarkets, all these users can manage their shipments and select the best for their shipping situation

# How it works

- The customer can create a new shipment request and select the service provider after the system filtering depends on addresses and weight of shipment

# How it works

- The service provider will receive the request on the map and then will assign the request to the delivery employee.
- The delivery employee will receive the shipping information of the package, and then will do the necessary
